

Assignment 6: GLMs (Linear Regressios, ANOVA, & t-tests)

Jinglin Zhang

Spring 2023

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Rename this file <FirstLast>_A06_GLMs.Rmd (replacing <FirstLast> with your first and last name).
2. Change “Student Name” on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure to **answer the questions** in this assignment document.
5. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (NTL-LTER_Lake_ChemistryPhysics_Raw.csv). Set date columns to date objects.
2. Build a ggplot theme and set it as your default theme.

```
knitr::opts_chunk$set(message = FALSE)
#1
getwd()
```

```
## [1] "C:/Users/wwwla/Documents/EDA-Spring2023"
```

```
library(tidyverse)
library(agricolae)
NTL.CHEM <- read.csv("~/EDA-Spring2023/Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv", stringsAsFactors = FALSE)
NTL.CHEM$sampldate <- as.Date(NTL.CHEM$sampldate , format = "%m/%d/%y")
#2
mytheme <- theme(
  plot.background = element_rect(fill = "white"),
  plot.title = element_text(size = 16, face = "bold"),
  axis.text = element_text(color = "black"),
  axis.line = element_line(colour = "black", size = 0.5),
  legend.position = "top",
  legend.text = element_text(size = 10)
)
```

```
## Warning: The 'size' argument of 'element_line()' is deprecated as of ggplot2 3.4.0.  
## i Please use the 'linewidth' argument instead.
```

```
theme_set(mytheme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: mean lake temperature recorded during July does not change with depth across all lake. Ha: mean lake temperature recorded during July does change with depth across all lake.
4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:
 - Only dates in July.
 - Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
 - Only complete cases (i.e., remove NAs)
5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

```
#4  
NTL.CHEM.PROSS <- NTL.CHEM %>%  
  mutate(month = month(sampledate)) %>%  
  filter(month == 7) %>%  
  select(lakename, year4, daynum, depth, temperature_C) %>%  
  drop_na(temperature_C)  
  
#5  
tempBYdepth <- ggplot(NTL.CHEM.PROSS, aes(x = depth, y = temperature_C)) +  
  ylim(0,35) +  
  geom_point() +  
  geom_smooth(method = "lm", col = "black", se = FALSE)  
print(tempBYdepth)
```

```
## Warning: Removed 24 rows containing missing values ('geom_smooth()').
```

6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

Answer: the figure indicates that the temperature will be decreased with the increase of lakee depth.the distribution of points does suggest this trend, which shows the points of shallow areas are generally higher than points in deep areas.

7. Perform a linear regression to test the relationship and display the results

```
#7
tempBYdepth.regression <- lm(data = NTL.CHEM.PROSS, temperature_C ~ depth)
summary(tempBYdepth.regression)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = NTL.CHEM.PROSS)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -9.5173  -3.0192   0.0633   2.9365  13.5834
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)  21.95597    0.06792   323.3  <2e-16 ***
```

```
## depth      -1.94621    0.01174  -165.8   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

Answer: the results indicate that there was a negative relationship between water temperature and water depth (temperature = $-1.946 \times \text{depth} + 21.956$), which is highly significant ($p < 0.001$). the degree of freedom is 9726, 1m change in depth will change 1.946 degree celsius of temperature.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.
10. Run a multiple regression on the recommended set of variables.

```
#9
temp.AIC <- lm(data = NTL.CHEM.PROSS, temperature_C ~ year4 + daynum + depth)
step(temp.AIC)

## Start:  AIC=26065.53
## temperature_C ~ year4 + daynum + depth
##
##           Df Sum of Sq    RSS   AIC
## <none>                 141687 26066
## - year4      1         101 141788 26070
## - daynum     1        1237 142924 26148
## - depth      1       404475 546161 39189

##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL.CHEM.PROSS)
##
## Coefficients:
## (Intercept)      year4      daynum      depth
##    -8.57556     0.01134     0.03978    -1.94644
```

```
#10
NTL.multi.regerssion <- lm(data = NTL.CHEM.PROSS, temperature_C ~ year4 + daynum + depth)
summary(NTL.multi.regerssion)

##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL.CHEM.PROSS)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715  -0.994  0.32044
## year4         0.011345   0.004299   2.639  0.00833 **
## daynum        0.039780   0.004317   9.215 < 2e-16 ***
## depth        -1.946437   0.011683 -166.611 < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic: 9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

Answer: the final set of explanatory variables include year4, daynum and depth. the year4 explains 0.011 variance, daynum explains 0.040 variance, daphth explain 1.946 variance, including the other variables is improvement of model beacuse the infulence of year4 and daynum are significant, which means they have influence on temperature.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```
#12
NTL.CHEM.GROUP <- group_by(NTL.CHEM.PROSS, lakename)
NTL.Lake.ANOVA <- aov(data = NTL.CHEM.GROUP, temperature_C ~ lakename)
summary(NTL.Lake.ANOVA)

##              Df Sum Sq Mean Sq F value Pr(>F)
## lakename         8  21642   2705.2      50 <2e-16 ***
## Residuals    9719 525813     54.1
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
NTL.Lake.lm <- lm(data = NTL.CHEM.GROUP, temperature_C ~ lakename)
summary(NTL.Lake.lm)
```

```
##
## Call:
## lm(formula = temperature_C ~ lakename, data = NTL.CHEM.GROUP)
##
## Residuals:
```

	Min	1Q	Median	3Q	Max
	-10.769	-6.614	-2.679	7.684	23.832

```
##
## Coefficients:
```

## F-statistic:    50 on 8 and 9719 DF,  p-value: < 2.2e-16
```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

Answer: both linear model and ANOVA results reveal a statistically significant difference between the lakes ($p < 0.001$)

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a `geom_smooth` (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
#14.
ggplot(NTL.CHEM.GROUP, aes(x = depth, y = temperature_C, color = lakename)) +
  geom_point(alpha = 0.5) +
  geom_smooth(method = "lm", se = FALSE) +
  ylim(0,35)
```

```
## Warning: Removed 73 rows containing missing values ('geom_smooth()').
```

15. Use the Tukey's HSD test to determine which lakes have different means.

#15

TukeyHSD(NTL.Lake.ANOVA)

```
## Tukey multiple comparisons of means
## 95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = NTL.CHEM.GROUP)
##
## $lakename
##
```

16. From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

Answer: mean T of ward lake is statistically same as peter lake. the central long lake have mean T that statistically distinct from all other lakes.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

Answer: we can apply 2 sample T test to check it.

18. Wrangle the July data to include only records for Crampton Lake and Ward Lake. Run the two-sample T-test on these data to determine whether their July temperature are same or different. What does the test say? Are the mean temperatures for the lakes equal? Does that match your answer for part 16?

```
NTL.CHEM.T <- filter(NTL.CHEM.PROSS, lakename == "Crampton Lake" | lakename == "Ward Lake")
NTL.Lake.T <- t.test(NTL.CHEM.T$temperature_C ~ NTL.CHEM.T$lakename)
NTL.Lake.T
```

```
##
## Welch Two Sample t-test
##
## data: NTL.CHEM.T$temperature_C by NTL.CHEM.T$lakename
## t = 1.1181, df = 200.37, p-value = 0.2649
## alternative hypothesis: true difference in means between group Crampton Lake and group Ward Lake is not equal to 0
## 95 percent confidence interval:
## -0.6821129 2.4686451
```

```
## sample estimates:
## mean in group Crampton Lake      mean in group Ward Lake
##              15.35189              14.45862
```

Answer: the results say the mean temperature for the lakes equal, which match my former answer.
